

FRACTION COMPACTION AND INCREASE YIELDS

Industry studies have shown that compaction reduces yields by keeping roots from moving freely in the soil, costing you money. Take control of your field and yield by fracturing compaction up to 20" deep with the **Zone-Builder®** subsoiler. You'll allow plant roots to find moisture and nutrients deeper in the soil while creating minimal surface soil disturbance. You can convert the Zone-Builder subsoiler into a pull-type implement by adding a **3-point caddy**.
